0.1 ADDENDUM NUMBER: 3

0.2 PROJECT INFORMATION
   A. Project Name: Baler Building / MRF Expansion
   B. Owner: City of Casper
   C. Architect: Hein Bond
   D. Date of Addendum: March 9, 2018

0.3 NOTICE TO BIDDERS
   A. This Addendum is issued to all registered plan holders pursuant to the Instructions to Bidders and Conditions of the Contract. This Addendum serves to clarify, revise, and supersede information in the Project Manual, Drawings, and previously issued Addenda. Portions of the Addendum affecting the Contract Documents will be incorporated into the Contract by enumeration of the Addendum in the Owner/Contractor Agreement.
   B. The Bidder shall acknowledge receipt of this Addendum in the appropriate space on the Bid Form.
   C. The date for receipt of bids is unchanged by this Addendum, at same time and location.

0.4 ATTACHMENTS
   A. This Addendum includes the following attached Documents and Specification Sections:
      1. Section 304 – Asphalitic Concrete, 10 pages, (new).
      5. Section 404 – Bituminous Tack Coat, 2 pages, (new).
   B. This Addendum includes the following attached Sheets:
0.5  REVISIONS TO PREVIOUS ADDENDA

A.  Addendum No. 2, Item 0.9, E: Sheet A103, (reissued).
1.  Detail 2, Push Wall Curb: Detail is changed to show two optional methods to construct.

B.  Addendum No. 2, Item 0.9, G: Sheet A601, (not reissued).
1.  Detail 10: Television is to be supplied in contract.
2.  Detail 14: Elevation shows two new lockers to be installed in Janitor 108. Lockers to match existing lockers in Locker Rooms 205/206.

0.6  REVISIONS TO DIVISION 00 PROCUREMENT REQUIREMENTS AND CONTRACTING REQUIREMENTS

1.  None

0.7  REVISIONS TO DIVISION 01 GENERAL REQUIREMENTS

1.  None

0.8  REVISIONS TO DIVISIONS 02 - 49 SPECIFICATION SECTIONS

A.  Specification Section 071113 – Bituminous Dampproofing, (not reissued).
1.  Paragraph 31., D, 1: Apply one spray coat.

B.  Specification Section 084513 – Structured Polycarbonate Panels
1.  Paragraph 2.3, A: AIA Eco-Wall 2560 is an approved product.

C.  Specification Section 084523 – Translucent Wall Assemblies, (not reissued).
1.  Paragraph 2.3, A: CPI Uniquad is an approved product.

D.  Specification Section 083613 – Sectional Doors, (not reissued).
1.  Provide portal windows in doors as shown on drawings.

E.  Specification Section 083323 – Overhead Coiling Doors, (not reissued).
1.  Paragraph 2.1, D: “Galvanized Steel with powder-coated finish; color as selected by Architect from manufacturer’s full range.
2.  Paragraph 2.1, H, 4: Change Obstruction detection device to 3-foot Light Curtain.

F.  Specification Section 102800 – Toilet and Bath Accessories, (not reissued).
1. Paragraph 2.1: Add Baby Change Station to be Koala Kare KB200 or equal.

2. Paragraph 2.1: Add mop rack, ASI 1308-3, to be installed in Janitor Room 108.

G. Specification Section 104400 – Fire Protection Specialties, (not reissued).
   1. Quantity: Provide 6 extinguishers and cabinets for the Baler Building, and 3 extinguishers and cabinets for the MRF. Location to be coordinated with Architect.

H. Specification Section 122116 – Vertical Louver Blinds
   1. Delete Specification.

0.9 REVISIONS TO DRAWING SHEETS

A. Sheet A401 – Wall Sections (not reissued).
   1. Drawing 3: Change ¼” acrylic plexiglass to wire bird mesh. Mesh to be galvanized or stainless steel, welded .08” diameter wire, with ½” maximum spacing.

B. Sheet A105 – Miscellaneous Enlarged Plans (revised in Addendum 2), (not reissued).
   1. Drawing 1: Walls in Restroom 106 and 107 mistakenly call for FRP on walls (wall type A2). Install ceramic tile on all walls in Restrooms 106 and 107 per Specification 093013.
   2. Drawing 4: East wall of Storage room 001 is identified as wall type F3. Change wall type to B1.

0.10 GENERAL CLARIFICATION OR REVISIONS

A. All asphalt paving material shall be placed, compacted and otherwise installed to conform with the newly revised Sections 304, 401, 402, 403 and 404 of the City of Casper Standard Specifications (February 2018). These new sections are attached in their entirety to Addendum #3. The top lift of asphalt (overlay) shall be the Type C (1/2”) Mix with regard to gradation. All other lifts shall be the Type A (3/4”) Mix with regard to gradation.

   1. The performance-graded asphalt binder (PGAB) shall be 64-28 for the proposed asphalt drive, and the Contractor may use either 64-22 or 64-28 for all required patching.

B. Appliance in Breakroom 105 are to be supplied in contract
   1. Refrigerator: Whirlpool Model WRT541SZDZ, or equal.
   2. Dishwasher: Whirlpool Model WDT750SAHZ, or equal
   3. Microwave: Whirlpool Model WMC50522HB, or equal.

END OF DOCUMENT 009113
DIVISION 300

SECTION 304

ASPHALTIC CONCRETE PAVEMENT

304.01 Description.

The work specified under this section shall consist of one or more courses of bituminous mixture constructed on a prepared foundation and in reasonably close conformity with the lines, grades, thicknesses, and typical cross-sections shown on the plans or established by the Engineer. This article also addresses asphaltic concrete pavement repairs performed as part of the installation of some appurtenance.

304.02 Materials.

A. General. The asphaltic pavement shall be hot mixed at a central plant. It shall consist of mineral aggregates, uniformly mixed with asphalt cement and laid upon the prepared base to the finished thickness shown on the typical cross-section on the plans or as directed by the Engineer. The composition of the combined mineral aggregate shall be crushed gravel.

B. Crushed Gravel Gradation. Crushed gravel shall consist of clean, hard, durable, stone particles which have been crushed, screened, and otherwise processed to meet the following requirements. The thickness and grading type shall be as specified in the Special Provisions.

*The proposed combined grading shall fall within these limits*

C. General. Aggregate shall be composed of coarse and fine aggregates combined in the proper proportions to meet the grading requirements shown above. Aggregates shall be composed of clean, tough, durable fragments, free from an excess of flat, elongated, soft, or disintegrated pieces and free from fragments coated with dirt or other objectionable matter.
D. **Coarse Aggregate.** Coarse aggregate shall be crushed stone or crushed gravel of such gradation that when combined with other required aggregate fractions and fillers in proper proportion, the resultant mixture shall meet the gradation required under the composition of mixture for the specific type under contract. The crushed aggregate shall have a percentage of wear of not more than 40 at 500 revolutions when tested in accordance with ASTM C131 and have a minimum 55% two fractured faces (ASTM D5821). The magnesium sulfate soundness loss shall not exceed 18% in accordance with ASTM C88, and the material shall be non-plastic.

E. **Fine Aggregate.** Fine aggregate shall consist of crushed stone, crushed gravel, or natural sand. The fraction passing the No. 200 (75\(\mu\)m) sieve shall not be greater than two-thirds (2/3) of the fraction passing the No. 40 (425\(\mu\)m) sieve. The fraction passing the No. 40 (425\(\mu\)m) sieve shall have a liquid limit not greater than 25 and a plasticity index not greater than three (3), except that when the plasticity index is non-plastic (NP), the liquid limit shall be not more than 30. The sand equivalent shall be a minimum of 40 (ASTM D2419). The fine aggregate angularity shall be a minimum of 40 (ASTM C1252).

F. **Reclaimed Asphalt Pavement (RAP).** RAP in an amount not to exceed 10% by weight of dry aggregate may be used. RAP shall be crushed and screened such that 100% of the RAP used passes a 2” (50 mm) sieve. The RAP shall be stockpiled separately. The source of RAP shall be identified in the mix design submittal, and shall not be changed without written authorization from the City or their designated representative. Mix designs including RAP shall note the amount of virgin binder to be added. **NOTE: The addition of RAP in excess of 10% shall constitute sufficient grounds for removal and replacement of all asphalt concrete placed on the project and prohibition of the use of RAP for the remainder of the project.**

G. **Performance-Graded Asphalt Binder (PGAB).** For full-depth new construction, PG 64-28 binder shall be required unless otherwise specified in the Special Provisions. For construction of overlays over existing asphaltic concrete pavement, the binder shall be the Contractor’s option of PG 64-22 or PG 64-28 unless otherwise specified in the Special Provisions. Performance-Graded binders with higher upper specification temperatures, decreased lower specification temperatures, or both, may be substituted upon written notice to the City or their designated representative. PGAB shall meet the requirements of Section 804.1, Performance Graded Asphalt Binder, of the current version of the Wyoming Department of Transportation Standard Specifications for Road and Bridge Construction.

H. **Warm Mix Asphalt (WMA).** The use of Warm Mix Asphalt technology is allowed, subject to the submittal requirements herein. When warm mix additives are proposed, provide the following information in addition to the mix design information at least two (2) weeks prior to start of paving:

1. WMA technology and/or WMA additives information;
2. WMA technology manufacturer’s established recommendations for usage;
3. WMA technology manufacturer’s established target rate for water and additives and the acceptable variation for production; and
4. WMA technology material safety data sheets (MSDS) or safety data sheets (SDS); For mixtures to be produced with plant foaming equipment, provide the equipment manufacturer and model, the manufacturer’s recommendations for rate of water addition and recommended operation parameters, and calibration information. For all WMA technology, provide:
   1. Temperature range for field mixing; and
   2. Temperature range for field compacting;
   3. Allowable ambient temperatures;
   4. Any necessary adjustments to curing or aging times for QC/QA testing.
Use equipment and WMA technologies capable of producing an asphalt mixture to meet the requirements specified herein and in the Special Provisions that is workable at the proposed mixing and compaction temperatures. The use of WMA technology in no way relieves the Contractor of the responsibility for meeting all other requirements.

I. Certificates of Compliance. Certificates of compliance for each consignment of PGAB shall be furnished by the Contractor to the City or their designated representative in accordance with the requirements of Division 400, Section 403.06 of the specifications.

304.02 Paving Plant Requirements.

A. General Requirements.

1. Uniformity. The plant shall be so designed and operated as to produce a job mixture whose permissible variance from the mix design shall be as follows:

   Amount passing on the No. 4 (4.75mm) sieve and larger +/- 7%
   Amount passing on the No. 8 (2.36mm) to No. 100 (150μm) sieves +/- 5%
   Amount passing on the No. 200 (75μm) sieve +/- 2.0%
   Asphalt Cement +/- 0.5%
   Laboratory air void content +/- 1.5%

1. Paving Plant Inspection. For verification of weights or proportions, including RAP content, and character of materials, and determination of temperatures used in the preparation of mixture, the City or their designated representative(s), shall have access at any time to all parts of the paving plant and shall, upon request, receive copies of production records including the proportions and/or quantities of materials used.

2. Composition of Mixtures. Mixing temperatures for bituminous mixes shall be determined by the submitted and approved mix design and recommendations of the binder supplier.

B. Asphaltic Pavement Mixture Design Criteria. The proposed mixture may be designed using either the Marshall or Superpave method in accordance with the criteria listed below.

### 304.04 Construction.

#### A. General Conditions.

1. **Proofrolling.** Prior to the placing of any hard surfacing material upon the subgrade/subbase/base, such subgrade/subbase/base shall be proofrolled. Notice of proofrolling shall be provided to the City or their designated representative sufficiently in advance of the operation to allow the City or their designated representative to observe the proofrolling. The proofrolling shall be done by a pneumatic-tired roller with tires having a ground contact pressure of 85-90 psi. (585-621 kPa) or a fully-loaded 4,000-gallon, three-axle water truck. The entire area upon which hard surfacing is to be placed must be rolled. When proofrolling shows an area to be unstable, such area shall be brought to satisfactory stability by additional compaction, reworking, or removal of unsuitable material and replacement with acceptable material. If paving operations have not begun within twenty-four (24) hours after approval, a repeat of the proofrolling may be required.

2. **Weather Limitations.** Bituminous plant mix shall not be placed on any wet or frozen surface or when the temperature of the surface on which the bituminous plantmix is to be placed is less than those specified in the following table; or when weather conditions otherwise prevent the proper handling or finishing of the bituminous mixtures:
**Surface Temperature Limitations**

</tr>
</tbody>
</table>

i. The meanings of the terms "surface course" and "subsurface course" applies to this subsection only, and shall be as follows:

a. Any plant mix pavement overlaid with surface course on the same contract is considered a subsurface course.

b. Plant mix bituminous base is considered a subsurface course.

c. Spot leveling or the bottom lift of a leveling course may be placed at 35° F (1.7°C) if additional courses are placed on the same contract.

**B. Transportation of Mixture.** The mixture shall be transported from the paving plant to the work in vehicles equipped with tight metal compartments previously cleaned of all foreign materials. When necessary, the compartments shall be suitably insulated and each load shall be covered with canvas or other suitable materials of sufficient size to protect it from weather conditions. The inside surface must be lightly lubricated with an asphalt (load-bed) release agent from the WYDOT Materials Acceptance – Manufactured Products Qualified Products list just before loading, but excessive release agent will not be permitted.

**C. Placing Asphalt Mixture.** The mixture shall be delivered on the work site at a temperature sufficient to allow for adequate workability and densification. Final rolling and density of the bituminous surface, subsurface, or leveling courses must be obtained prior to the mixture reaching a minimum temperature of 180° F (82°C).

1. Unless otherwise permitted by the City or their designated representative, the mixture shall be spread by means of a mechanical self-powered paver, capable of spreading the mixture true to the line, grade, and crown shown on plans. Hand-placing and spreading will be permitted only in irregular areas where it is impractical to use a paving machine.

2. Pavers shall be equipped with hoppers and distributing screws of the reversing type to place the mixture evenly in front of adjustable screeds. The mixture shall be dumped in the center of the hoppers and care exercised to avoid overloading and spilling over the mixer upon the base. Pavers shall operate, when laying mixtures, at such speed for a consistent and uniform laying of the mixture.
3. Pavers shall be equipped to automatically control the laying of the mixture to specified transverse slope and established longitudinal grade. The paver control system shall be automatically actuated from an independent line and grade control reference through a system of sensors and sensor-directed devices which shall maintain the paver screed at the proper transverse slope and height to establish the top surface of the compacted mixture at specified slope and grade.

4. The screed or "strike-off" assembly shall produce the specified finished surface without tearing, shoving, or gouging, and which produces a finished surface of the evenness and texture specified. The screed shall be adjustable as to level and shall have an indicating level attached and shall be vibrating.

5. Immediately after any course is screeded, and before roller compaction is started, the surface shall be checked, and all inequalities adjusted. Irregularities in alignment and grade along the outside edge shall also be corrected by the addition or removal of mixture before the edge is rolled.

6. In narrow, deep, or irregular sections, intersections, turnouts, or driveways where it is impractical to spread and place asphalt mixes by machine methods, the Contractor may use approved spreading equipment or acceptable hand methods as allowed by the City or their authorized representative. Excessive loose rock shall be removed from surface prior to rolling the patch.

7. The placing of the mixture shall be as continuous as possible.

D. Joints. Transverse construction joints shall be made in a careful manner. The edge of the previously laid course shall be cut back as far as is necessary to eliminate irregularities incidental to finishing and rolling. After laying the finished mixture adjacent to a transverse construction joint, a skilled laborer shall follow up each rolling with a straightedge and corrective measures to insure a smooth riding surface.

1. Longitudinal joints against both hot and cold material shall be made with equal care. Mixtures spread and compacted (or partially compacted) by the machine shall not be disturbed by a rake in dressing the joint, unless one side is too high, nor shall surplus mixture be spread or scattered back of the machine when not needed to build up low spots. When spreading next to a warm or cold edge of a previously laid section of surfacing, the machine shall be adjusted to leave a "bead" of material, roughly one inch (1") (25mm) by one inch (1") (25mm), which shall be rolled in to compensate for uneven density at the joint. If one side of the joint is cold, the "bead" shall be moved back of the rake to the warm side of the joint but otherwise the machine-laid mixture shall not be disturbed.

2. In making the joint along any adjoining edge such as curb, gutter, or an adjoining pavement, and after the hot mixture is placed by the finishing machine, just enough of the hot material shall be carried back to fill any space left open, and provide a small "bead" of extra material. This joint shall be properly "set-up" with the back of the
rake at proper height and bevel to receive the maximum compression under rolling. The work of "setting-up" this joint shall always be performed by competent workmen, who are capable of making a correct, clean, and neat joint.

E. Bonds Between Existing and New Asphalt.

1. In order to obtain a good bond between existing and new asphalt pavements, all areas where the existing pavement is cut for the installation of an appurtenance or structure the Contractor shall saw cut, cold mill, or otherwise remove to a neat line the full depth of the existing asphalt pavement a minimum of twelve inches (12") (300mm) beyond the excavation. This entire edge shall be properly coated with bituminous tack coat prior to the installation of the new asphalt pavement. The new pavement section shall be applied in two (2) lifts. In addition, as directed by the City or their authorized representative, after the first lift is applied, the edge of the old asphalt pavement shall be milled down to the level of the first lift of the new pavement section or a minimum of one and one-half (1½") (37.5mm) from the surface. The milling shall extend at least twelve (12") (300mm) beyond the saw cut. The milled surface shall be thoroughly cleaned and have bituminous tack coat applied to and coated to cover the entire edge before applying the second lift. The second lift will then be applied overlapping the milled surface and the new first lift of the new pavement. If the second lift cannot be applied immediately after compaction of the first, the first lift shall have tack applied to its surface before the application of the second.

F. Compaction of the Mixture. As soon as the mixture will carry the compaction equipment without undue shoving or displacement, it shall be compacted with self-propelled rollers. The number and weight of rollers shall be sufficient to compact the mixture to the required density while it is still in a workable condition. The use of equipment which results in excessive crushing of the aggregate will not be permitted.

1. Rollers shall be self-propelled and capable of reversing without backlash. Pneumatic-tired rollers shall be equipped with covers or skirting to maintain tire temperature. Vibratory rollers shall be equipped with a variable amplitude and frequency system. Rollers and/or roller operation that adversely affect the surface of the plant mix pavement shall not be used.

2. All rollers shall be maintained in good mechanical condition, and those that cannot be driven along a straight path or operated without jerking, shall not be used. No leakage of petroleum products from any roller shall be allowed to come in contact with pavement being constructed, nor shall any roller be permitted to stand motionless on any portion of the work. The surfaces of all roller wheels shall be misted with sufficient water and/or asphalt release agent to prevent the pickup of bituminous materials, but under no circumstances shall the quantity of water or release agent used be detrimental to the surface of the pavement being rolled. Water shall not be applied directly in any manner to the asphalt surface.
3. As soon as the layer of asphalt concrete has been placed, it shall be thoroughly compacted by rolling. Except when compacting lifts greater than four inches (4") (100mm) in compacted thickness, rolling shall be commenced along the lower edge of the area to be rolled and continued until the edge is thoroughly compacted, after which the roller shall be gradually advanced to the crown point, both sides being rolled in like manner. Rolling shall be continued until the pavement layer has become thoroughly compacted throughout and is true to grade and cross-section.

4. For lifts greater than four inches (4") (100mm) in compacted thickness, rolling shall be commenced in the middle of the mat, after which the roller shall be gradually advanced to both edges. The roller should be advanced to a supported edge first, if applicable. Rolling of an unsupported edge should be delayed as long as possible, provided the required densities are obtained after the completion of the finishing rolling.

5. The finish rolling of the surface course shall be done with a tandem steel-wheeled roller until all roller marks are eliminated.

6. Along curbs, headers, manholes, and similar structures, and at all places not accessible to the roller, thorough compaction must be secured by any means necessary to produce a uniform surface finish and the required compacted thickness. At all contacts of this character, the joints between these structures and the surface mixture must be effectively sealed with a bituminous tack coat.

7. After final compaction, the surface course shall conform with the following requirements:

i. It shall be smooth and true to the established crown and grade. It shall have the average thickness specified and shall at no point be more than one-fourth inch (1/4") (6.25mm) less than the thickness shown on the typical cross-sections on the plans. Any low or defective places shall immediately be remedied to the satisfaction of the City or their designated representative by overlay or cutting out the course at such spots and replacing it with fresh, hot mixture which shall be immediately compacted to conform to the surrounding areas and shall be thoroughly bonded to it. The surface of the finished pavement shall be free from depressions exceeding one-fourth inch (1/4") (6.25mm) as measured with a ten foot (10') (3m) straight edge in any direction, and shall be free of puddles, “bird baths,” or areas that do not drain.

ii. Areas that meet the thickness requirements but fail the smoothness requirements shall be corrected to the satisfaction of the City or their designated representative by overlay, removal and replacement, or diamond grinding. The grinder, if used, shall be a power-driven, self-propelled machine with a minimum 3-foot (1 m) wide cutting head and effective wheelbase of not less than 12 feet (3.5 m). The grinding equipment shall not cause excessive raveling, aggregate fracturing, or spalling. Bush hammers or other impact devices will not be allowed. Areas
corrected by diamond grinding shall be extended such that the completed correction appears workmanlike, neat, and is approximately rectilinear. Tack coat shall be applied to all areas that have been diamond ground.

iii. Areas that fail to meet the thickness requirements shall be corrected by removal and replacement, overlay, reduced compensation, or through other remedy acceptable to the City or their designated representative. Upon approval of the City or their designated representative, additional coring may be performed to assess the severity and extent of any thickness deficiency. Additional coring shall be at the expense of the Contractor.

8. At no point shall the density of the binder and surface course be less than 93% of the theoretical maximum (Rice) specific gravity. Longitudinal joints shall be at least 91% of the theoretical maximum (Rice) specific gravity, measured within six (6) inches of the joint. (See Division 400, Section 402.03.)

G. Construction Testing and Sampling. All testing and sampling shall be done in accordance with the latest ASTM methods unless otherwise specified. Test results shall be forwarded immediately by the testing lab to the City or their designated representative and general Contractor. The following tests shall be required during construction:

1. Asphalt Content and Gradation. One asphalt content and gradation test shall be made per each five hundred tons (500 t) (454 metric t) or portion thereof of asphaltic mixture placed per day. These tests shall be performed on samples taken prior to screening. The percentage of asphalt content may be determined by Ignition Oven or by Extraction Method (ASTM D 2172, D 6307, AASHTO T164).

2. Mixture Properties. A complete test series, as described below, shall be performed for each five hundred tons (500 t) (454 metric t), or portion thereof.

   i. Marshall Mix Design: Laboratory-compacted bulk specific gravity \( (G_{mb}) \), theoretical maximum (Rice) specific gravity \( (G_{mm}) \), air voids, voids in mineral aggregate, voids filled with asphalt, Marshall stability, Marshall flow.

   ii. Superpave Mix Design: Laboratory-compacted bulk specific gravity \( (G_{mb}) \), theoretical maximum (Rice) specific gravity \( (G_{mm}) \), air voids, voids in mineral aggregate, voids filled with asphalt,.

3. Density Tests. At least three (3) mat and three (3) longitudinal joint density tests for each five hundred tons (500 t) (454 metric t) or portion thereof shall be performed. Density testing will be based on cores unless the City or their designated representative authorizes the use of nuclear density gauges correlated with cores. The theoretical maximum (Rice) specific gravity values for each lot shall be used for computation of density of the same lot.
4. **Preconstruction Test and Sampling.** All sampling and testing of materials shall be done in accordance with the latest ASTM methods unless otherwise specified. The Contractor shall:

i. Submit suitable samples of all materials including asphalt cement to a City-approved AASHTO-accredited materials testing laboratory for mixture design, and to determine compliance of materials to these specifications, with results provided to the City or their designated representative at least two (2) weeks prior to paving;

ii. Or shall submit certification that the materials to be used are in conformance with these specifications and that the mixture design for use with these materials is approved and on file with the City Engineer. The City reserves the right to require confirmation testing, provided by the Contractor, of material properties for mix designs more than one year old.

5. The Contractor shall be responsible for all tests and sampling, mixture property testing, and all asphalt content and gradation testing. The Contractor shall select and pay for an AASHTO-accredited testing firm, acceptable to the City or their designated representative. If the initial test fails to meet minimum requirements, the Contractor shall pay for any and all additional tests until the requirements herein are met.

6. The City reserves the right to perform such additional testing, using an AASHTO-accredited laboratory, deemed necessary to verify the testing provided by the Contractor. In case of dispute, the City’s results shall govern.

H. **Warranty or Inspection of Asphaltic Concrete Pavement.** After completion of the asphalt and concrete work and prior to the end of the specified two-year warranty period, the City or their designated representative will inspect all asphalt and concrete areas installed on this project. At the time of the inspection, all areas of asphalt where there exists a one quarter inch (1/4”) (6 mm) separation between the new asphalt and the existing asphalt or the new asphalt and the new concrete, the Contractor will be required to crack seal these locations following City specifications. The sealant shall conform to ASSHTO M 301 or Section 304, Page 11 of 11 modified ASTM D 3405. Any pavement found to have settled more than one-quarter inch (1/4”) (6mm) shall be repaired in a manner acceptable to the City or their designated representative.
DIVISION 400

SECTION 401

PAVEMENT SUBBASE COURSE

401.01 Description.

The work covered by this Section shall consist of furnishing, placing, watering, shaping, and compacting a course of crushed stone or crushed gravel, and an approved soil binder or natural filler, to provide a firm and stable foundation for subsequent construction. The subbase course shall be constructed on a previously prepared subgrade in accordance with the requirements in these Specifications and the typical cross-section shown on the plans.

401.02 Materials.

A. General. Before production of any of the following materials, all vegetation, topsoil, and overburden shall be removed from the pit area to be used. The composite materials shall be free from clay balls, vegetable matter, and other deleterious substances, and shall not contain an excess of thin or elongated pieces.

B. Crushed subbase shall be crushed stone or crushed gravel and an approved soil binder or natural filler, where required, conforming to the following requirements, unless otherwise designated on the plans or in the special provisions.

1. Coarse aggregate shall consist of hard, durable particles, or fragments of stone or gravel. Materials that break up when alternately frozen and thawed or wetted and dried shall not be used. Unless otherwise specified, the coarse aggregate shall have a Los Angeles abrasion loss (ASTM C131) at 500 revolutions of not more than 50%.

2. Subbase material shall have a minimum Resistance (R) value of 60 when tested in accordance with ASTM D2844.

3. Fine aggregate shall consist of crushed stone, crushed gravel, or natural sand. The fraction passing the No. 200 (75\(\mu\)m) sieve shall not be greater than two-thirds (2/3) of the fraction passing the No. 40 (425\(\mu\)m) sieve. The fraction passing the No. 40 (425\(\mu\)m) sieve shall have a liquid limit not greater than twenty five (25) and a plasticity index not greater than six (6) except that, when the plasticity index is non-plastic, the liquid limit shall not be more than thirty (30) per ASTM D4318.

4. Crushed base shall meet one of the following gradation requirements, or as specified by the drawings:
<table>

</table>

C. Subbase shall be crushed stone or gravel meeting the wear, liquid limit, plasticity index and gradation requirements specified for crushed subbase.

D. Crusher run subbase shall be crushed material of the maximum size as called for on the plans or Special Conditions.

### 401.03 Subgrade Preparation.

The subgrade shall be prepared in accordance with Division 200, Section 201 of these Specifications. Immediately prior to placing the subbase material, the subgrade shall be true to line and grade and shall be smooth, dense, and free from ruts, depressions, and irregularities. The subbase course shall not be placed until the subgrade has been approved by the Engineer.

### 401.04 Placing.

The subbase course material shall be placed on previously prepared subgrade at the locations and in the proper quantities to conform to the typical cross-sections as shown on the plans and directed by the Engineer. The subbase material shall be placed in lifts not exceeding eight inches (8") (200mm) in final thickness. Placing and spreading shall be done by means of spreading machines, motor graders, or any other approved equipment and methods. The method of spreading and placing shall be such that segregation of the coarse and fine particles is avoided. If undue segregation occurs the method of spreading and placing shall be modified so that the placement is made to the satisfaction of the Engineer.

### 401.05 Laying and Compacting.

A. After the subbase course material has been placed and uniformly spread over the prepared subgrade, compaction shall be accomplished by means necessary to meet the density requirements herein. If additional water is needed to facilitate compaction and bonding of the materials, it shall be applied in a controlled manner such that the moisture content requirements are met and with no adverse effects to the underlying or surrounding materials or facilities.
B. Rolling shall be continued until the subbase material has been compacted to a density of at least 90% minimum dry density as determined by ASTM D1557 and a moisture content within plus 2% to minus 4% of optimum.

C. The finished subbase surface shall be smooth and free from ruts and irregularities and true to grade and crown as shown by the plans or as directed by the Engineer. Tolerance and smoothness shall be as specified in Division 200, Section 201.03. Any deviations in excess of these amounts shall be corrected by loosening, adding, or removing materials, reshaping, and recompacting by wetting and rolling. The subbase course material shall be maintained in this condition by watering, rolling, or blading as necessary and to the satisfaction of the Engineer until the base course is applied.

401.06 Quality Control.

A. Preconstruction Testing. All testing and sampling shall be done in accordance with the latest ASTM methods unless otherwise specified. At least two weeks in advance the Contractor shall:

1. Submit representative samples of the subbase material to the City’s materials testing laboratory, if one has been designated, for tests to determine the compliance of the proposed subbase material with these specifications;

2. Or shall submit certification based on testing performed within the last 12 months by an AASHTO-accredited or otherwise-approved laboratory that the subbase materials to be used are in accordance with these Specifications.

B. Construction Testing. Prior to and during construction, the supplier/Contractor shall have performed by an AASHTO-accredited or otherwise approved testing laboratory, one gradation test including liquid limit and plasticity index per each two thousand square yards (2,000 sq. yds) (1,675 sq. m), and one moisture and density test per each five hundred square yards (500 sq. yds) (418 sq. m) placed, or portion thereof. Copies of the results of such tests shall be submitted by the laboratory to the City or their designated representative and Contractor within three business days. The City reserves the right to test the material for conformance with these specifications. In the event of a dispute, the City’s results shall govern. No single test result will represent more than 2,000 square yards.
DIVISION 400

SECTION 402

PAVEMENT BASE COURSE

402.01 Description.

The work covered by this Section shall consist of furnishing, placing, watering, shaping, and compacting a course or courses of crushed gravel to provide a firm and stable foundation for subsequent construction. The base course shall be constructed on a previously-constructed subbase or subgrade in accordance with the requirements of these specifications and in conformity with the lines, grades, quantity requirements, and the typical cross-sections shown on the plans.

402.02 Materials.

A. Crushed Gravel. The crushed gravel for base course shall consist of clean, hard, durable particles which have been crushed to the following gradations:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>% Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Grading W</td>
</tr>
<tr>
<td>2” (50 mm)</td>

</tr>
<tr>
<td>#200 (75 µm)</td>
<td>3-12</td>
</tr>
</tbody>
</table>

1. The type of base course to be applied is the Contractor’s option unless otherwise specified in the special provisions.

2. Base material shall have a minimum Resistance (R) value of 70 when tested in accordance with ASTM D2844, and the coarse aggregate shall have a maximum magnesium sulfate (MgSO₄) soundness loss of 18% when tested in accordance with ASTM C88.

3. Coarse aggregate shall consist of hard, durable particles, or fragments of stone or gravel. Materials that break up when alternately frozen and thawed or wetted and dried shall not be used. Unless otherwise specified, the coarse aggregate shall have a Los Angeles abrasion loss (ASTM C131) at 500 revolutions of not more than 50%.
4. Fine aggregate shall consist of crushed stone, crushed gravel, or natural sand. The fraction passing the No. 200 (75\(\mu\)m) sieve shall not be greater than two-thirds (2/3) of the No. 40 (425\(\mu\)m) sieve. The fraction passing the No. 40 (425\(\mu\)m) sieve shall have a liquid limit not greater than twenty-five (25) and a plasticity index not greater than six (6) except that, when the plasticity index is non-plastic, the liquid limit shall not be more than thirty (30) per ASTM D4318.

5. Of the particles retained on a No. 4 (425\(\mu\)m) sieve, at least 35% by weight shall have one (1) or more fractured faces as determined by ASTM D5821.

B. Recycled Aggregate Base. At the option of the Contractor, recycled aggregate base manufactured from asphalt concrete and/or Portland cement concrete may be used if it conforms to the following gradation requirements and has a minimum Resistance (R) value of 70 when tested in accordance with ASTM D2844.

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent Passing by Weight</th>

</tr>
<tr>
<td>No. 200</td>
<td>0-12</td>
</tr>
</tbody>
</table>

C. Preconstruction Testing. All testing and sampling shall be done in accordance with latest ASTM methods, unless otherwise specified. At least two (2) weeks in advance (except for Type 2 Recycled Aggregate Base, for which samples and/or certifications shall be submitted within five (5) business days of the start of on-site recycling) of the beginning of base work, the Contractor shall:

1. Submit representative samples of the base material to the City’s materials testing laboratory, if one has been designated, for tests to determine the compliance of the proposed subbase material with these Specifications;

2. Or shall submit certification based on testing performed within the last 12 months by an AASHTO-accredited or otherwise-approved laboratory that the materials to be used are in conformance with these Specifications.

D. Construction Testing. During construction the supplier/Contractor shall have testing required by Subsection 402.05, Quality Control Testing, performed by an AASHTO-accredited or otherwise approved testing laboratory. The results of such tests shall be submitted by the laboratory to the City or their designated representative and Contractor within three business days.
402.03 Mixing.

Before production of base materials, all vegetation, topsoil, and overburden shall be removed from the pit area to be used. For recycled aggregate base, the asphalt concrete and/or Portland cement concrete shall be separated from any deleterious materials prior to processing. The crushing and screening plant shall be equipped with any combination crushing and screening devices which will produce the required material. The moisture content of base materials shall be between plus 2% and minus 4% of optimum prior to placement and compaction. Care shall be exercised in the operation of loading, hauling, and distributing the crushed material to avoid segregation of the coarse and fine particles of the total material. If segregation occurs, the method of spreading and placing shall be modified so that placement is made to the satisfaction of the Engineer. The base course shall be placed on the previously-prepared subbase or base course in the proper quantities to conform to the typical cross-section shown on the plans. The base course thickness specified by the plans is absolute minimum thickness. Where the subbase has been left low, the Contractor may, at his option, use base course material as covered in this section of specifications to bring the subbase up to the grade specified.

402.04 Shaping and Compaction.

After the base course material has been placed and uniformly spread over the prepared subbase, compaction shall be accomplished by means necessary to meet the density requirements herein. If additional water is needed to facilitate compaction and bonding of materials, it shall be applied in a controlled manner such that the moisture content requirements are met and with no adverse effects to the underlying or surrounding materials or facilities. Rolling shall be continued until the entire base course has been compacted to the required density and moisture content.

A. The finished base surface shall be smooth and free of ruts and irregularities and true to grade and crown and thickness as shown by the plans or directed by the Engineer.

B. Each layer shall be compacted to a density of not less than 95% of maximum density and a moisture content of plus 2% to minus 4% of optimum moisture, as determined in accordance with ASTM D1557, unless otherwise called for on the plans. Compactions or field-in-place densities will be determined by sand cones (ASTM D1556) or nuclear density meters (ASTM D2922). The surface of each layer shall be maintained during the compaction operations in such a manner that a uniform texture and surface is produced and the aggregates firmly keyed. Water shall be uniformly applied over the materials during compaction in the amount necessary for proper consolidation.

C. The maximum compacted thickness of any one layer shall not exceed eight inches (8" - 200 mm).

402.05 Quality Control Testing.

A. Prior to commencement of base placement operations, the Contractor shall submit for approval the name and address of the AASHTO-accredited or otherwise-approved quality control laboratory proposed for use. The Contractor shall provide the following:
B. A minimum of one density and moisture test for every five hundred square yards (500 sq. yds) (418 sq. m) of base course placed.

C. A minimum of one gradation test, including liquid limit and plasticity index, for every two thousand square yards (2,000 sq. yds) (1,675 sq. m.) placed, or portion thereof.

D. The quality control laboratory shall submit copies of the results of all required testing to the City or their designated representative and Contractor within three business days.

E. The City reserves the right to test the material for conformance with these specifications. In the event of a dispute, the City’s results shall govern. No single test result will represent more than 2,000 square yards.
DIVISION 400

SECTION 403

PRIME COAT

403.01 Description.

This Section covers work necessary to prepare and seal an existing aggregate surface, and if required, a blotter, in accordance with these specifications.

403.02 Surface Preparation.

Prior to placing the prime coat, the base course shall be smooth, free from ruts, irregularities, and true to line and grade. All base courses shall be approved by the Engineer before the prime coat is placed. The base surface shall be cleaned to remove all loose or foreign material. The base course surface shall be moderately moist but shall not contain any free or ponded water, unless otherwise recommended by the manufacturer of the prime coat material used.

403.03 Materials.

The prime coat shall be, at the Contractor’s option, one of the following, unless otherwise specified in the contract documents.

1. Liquid cutback asphalt, grade MC-70, meeting the requirements of AASHTO Standard Specification M-81 or M-82, but without applying the Saybolt-Furol viscosity alternate.

2. Solvent-Free Emulsified Prime Penetrating / Priming Asphalt complying with the following requirements prior to dilution and handled and applied in accordance with the manufacture’s recommendations:

<table>
<thead>

<td>90 - 250</td>
</tr>
</tbody>
</table>

3. Topein® S, as produced by Alon Asphalt Company, diluted and applied in accordance with the manufacturer’s recommendations for prime coat.

403.04 Weather Limitations.

Unless otherwise recommended by the manufacturer or specifically directed by the Engineer, no prime coat shall be placed when the atmospheric temperature is less than 50° F. (10° C) ambient,
or when in the opinion of the Engineer, excessive wind or other atmospheric conditions will not permit satisfactory placement of the prime coat.

403.05 Application.

A. Prime coat shall be applied and maintained such that a continuous waterproof membrane is formed and maintained. The prime coat shall be placed by means of an approved pressure distributor. The distributor shall be in good mechanical condition and shall be capable of uniformly distributing the prime coat throughout a reasonable range of widths, pressures, temperatures, and application rates. Distributor equipment shall include a tachometer, pressure gauges, accurate volume measuring devices, and an accurate thermometer for reading temperatures of tank contents. Unless otherwise recommended by the manufacturer, prime coat shall be applied at a rate of not less than 0.15 gals./sq. yd. (0.9/l/sq. m) nor more than 0.30 gals./sq. yd (2.3/l/sq. m) as directed by the Engineer. Temperature of liquid cutback asphalt at application shall be between 90° F (32° C) and 180° F (82° C). The prime coat shall be carefully and uniformly applied, particularly around curbs, sidewalks, and other structures, and if excessive amounts of prime coat material are sprayed on the curbs, sidewalks, and other structures, they shall be cleaned as directed by the Engineer at the Contractor's expense. Excessive lapping of abutting applications will not be permitted. Should excessive lapping occur, the prime coat in the lapped portion shall be removed and replaced as directed by the Engineer at the Contractor's expense.

B. All spots missed by the distributor or areas which are inaccessible to the distributor shall be hand sprayed. Particular attention shall be given to hand spraying operations to avoid the application of excessive amounts of prime coat material.

C. Unless otherwise recommended by the manufacturer, the primed surface shall be allowed to cure for at least twenty-four (24) hours before placing any bituminous pavement. The primed surface shall be maintained by the Contractor until the bituminous pavement is placed. Any damaged areas shall be repaired as directed by the Engineer and at the Contractor's expense. All vertical contact surfaces such as concrete gutters, manholes, drainage structures, curbs, and so forth shall be primed by painting with hot asphaltic cement of the same grade being used in the asphaltic pavement just prior to placing the asphaltic pavement.

D. If ordered by the Engineer, desired by the Contractor, or recommended by the manufacturer of the prime coat material, blotter meeting the requirements shown below shall be applied at a rate sufficient to adsorb any prime coat material not absorbed into the surface to which the prime coat is applied. Blotter shall not be applied until the prime coat material has had sufficient time to penetrate into the surface to which the prime coat is applied. Excess blotter that is not adhered to the prime coat shall be removed in a manner that does not damage the prime coat prior to allowing uncontrolled public traffic or paving on the primed surface.
403.06 Quality Control.

A test report shall be obtained from the vendor by the Contractor at the time of shipment of each consignment of prime coat material. This test report shall be submitted to the City or their designated representative for approval prior to application or use of any prime coat material in the work. The test report shall show loading temperature, quantity in weight, quantity in gallons at 60° F (15.5° C), viscosity, A.P.I. or specific gravity at 60° F (15.5° C), characteristics of residue and distillation ends of the material contained in the consignment, percent and type of additive included when specified, or such other information to demonstrate conformance with the requirements herein. The Contractor shall also provide the manufacturer’s handling, application, curing, and any other recommendations at least one week in advance of applying the prime coat material.

DIVISION 400
SECTION 404
BITUMINOUS TACK COAT

404.01 Description.
This work described in this Section shall consist of preparing and treating an existing bituminous or concrete surface with bituminous material. Application of tack coat material shall be as specified in the contract documents.

404.02 Surface Preparation.
Prior to placement of the bituminous tack coat, the pavement surface shall be clean, dry, and free of all loose and foreign material. All pavement surface shall be approved by the Engineer before the tack coat is placed.

404.03 Materials.
At the option of the Contractor, tack coat materials may be a slow-setting emulsion, a rapid-setting emulsion, a quick-setting emulsion, or a Performance Graded asphalt cement with a high temperature grade equal or higher than the highest temperature grade required for the asphaltic concrete pavement. Emulsions shall conform to the requirements of AASHTO M 140, M 208, ASTM D 977, D 2397, WYDOT Standard Specification Table 804.3-1, or AASHTO M 320, as appropriate for the selected material.

404.04 Weather Limitations.
Unless otherwise specifically directed by the Engineer, no tack coat shall be placed when the ambient air is below 40° F. (4.4°C), or when, in the opinion of the Engineer, excessive wind or other atmospheric conditions will not permit satisfactory placement of the tack coat.

404.05 Placing of the Tack Coat.
A. The tack coat shall be placed by means of an approved pressure distributor. The distributor shall be in good mechanical condition and shall be capable of uniformly distributing the tack coat throughout a reasonable range of widths, pressures, temperatures, and application rates. Unless otherwise approved by the City, distributor equipment shall include a tachometer, pressure gauges, accurate volume measuring devices, and an accurate thermometer for reading temperatures of tank contents. The tack coat shall be applied at a residual asphalt rate of 0.03-0.05 gals./sq. yd (0.14 - 0.23 liters/sq.m) unless otherwise approved. Prior to placement the material shall be handled and heated in accordance with manufacturer’s recommendations. Dilution of emulsions shall not exceed a one-to-one ratio of added water to original emulsion. The volumes or weights of original emulsion and
any added water shall be reported to the City or their designated representative prior to application of the emulsion.

B. The tack coat shall be carefully and uniformly applied, particularly on all vertical surfaces against which asphaltic pavement is to be placed, around curbs, sidewalks, and other structures, and if excessive amounts of bituminous oil are sprayed on the curbs, sidewalks, and other structures, they shall be cleaned as directed by the Engineer at the expense of the Contractor. Excessive lapping of abutting applications will not be permitted. Should excessive lapping occur, the tack coat in the lapped portion shall be removed and replaced as directed by the Engineer at the Contractor's expense.

C. All spots missed by the distributor or areas which are inaccessible to the distributor shall be hand sprayed. Particular attention shall be given to hand spraying operations to provide complete coverage and to avoid the application of excessive amounts of bituminous oil.

D. The tacked surface shall be allowed to cure before placing any asphaltic concrete. The tacked surface shall be maintained by the Contractor until the asphaltic concrete is placed. Any damaged areas shall be repaired as directed by the Engineer and at the Contractor's expense. All vertical contact surfaces such as concrete gutters, manholes, drainage structures, curbs, and so forth, shall be tacked by painting with a hot asphaltic cement of the grade used in the asphaltic pavement just prior to placing the asphaltic pavement.

E. When the first course of asphaltic concrete is to be immediately covered by the second course of asphaltic concrete, the tack coat may not be required. When the first coat of asphaltic concrete is subjected to traffic, rain, blowing dust, and/or other unfavorable conditions, the tack coat shall be applied.

404.06 Test Reports.

Certificates of compliance for the bituminous tack coat material shall be supplied by the Contractor and furnished to the City or their designated representative for each consignment of asphaltic material as provided Division 400, Section 403.06 of these Specifications.
